

Ramp-Up Itinerary

AI workflow & end-to-end deployment skills — Link Ventures internal tooling

WINDOW

Fri Jul 3 – Tue Jul 7, 2026

JOB START

Mon, July 20, 2026

FOCUS

Agent loops, sandboxing,
Docker, AWS

Why this order: Day 1 builds shared vocabulary (watch the Claude Code workflow video, skim loop/agent concepts). Days 2–3 get your hands dirty with the deployment primitives (Docker, then AWS) so you have real infrastructure to build on. Day 4 goes deep on agent loops/harnessing/sandboxing and scopes your project. Day 5 is a capstone build day that ties all four pieces — loop, sandbox, container, cloud deploy — into one small, real thing. You'll have two more weeks after this (through Jul 20) to go deeper on whatever resonates most.

Day 1 — Foundations & Orientation

Fri, Jul 3

☐ **Watch: "Building a REAL feature with Claude Code: every step explained" (Matt Pocock)**

NOTION TASK

github.com/mattpocock/course-video-manager walkthrough — brainstorming → autonomous implementation → QA. Take notes on his end-to-end workflow; this is the closest real-world analog to "internal tooling" building.

☐ **Skim 1–2 short pieces on agent loops / harness engineering** **READ**

Just enough to get the vocabulary (ReAct, harness, loop termination) before Day 4's deeper dive. See Resources, Topic 1.

☐ **Environment setup** **HANDS-ON**

Install/verify Docker Desktop, AWS CLI, and an AWS account/credentials you can build with this weekend.

☐ **Jot 3–5 notes on what "internal tooling" might mean at a VC**

Deal-flow research agents, CRM/portfolio sync, reporting automation, meeting-notes pipelines — use this to seed Day 4's project ideation task.

Day 2 — Docker, Hands-On

Sat, Jul 4

- ☐ **Work through a Docker crash course actively** HANDS-ON
roadmap.sh/docker as your outline; pause and type every command yourself rather than just watching.
- ☐ **Containerize something real** HANDS-ON
Take an existing script or small app of yours, write a Dockerfile, build the image, run the container. Images vs. containers, volumes, and networking should stop feeling abstract.
- ☐ **Learn Docker Compose** HANDS-ON
Spin up a 2-service local stack (e.g. a small API + a database) to get comfortable with multi-container setups — this is how most real internal tools are actually run.
- ☐ **Push an image to a registry** HANDS-ON
Docker Hub or similar, just to close the loop on build → push → pull.

Day 3 — AWS Fundamentals & First Deploy

Sun, Jul 5

- ☐ **Orient with roadmap.sh/aws** READ
Focus on IAM basics, EC2 vs. ECS vs. Lambda, and S3 — don't try to learn all of AWS, just enough to deploy and reason about tradeoffs.
- ☐ **Deploy the container from Day 2 to AWS** HANDS-ON
ECS Fargate is the closest analog to how internal tools typically get run; Lambda is a good alternative if you'd rather get serverless reps in instead.
- ☐ **Stretch: wire up basic CI** HANDS-ON
A GitHub Actions step that builds and pushes your image on commit — nice to have, skip if short on time.

Day 4 — Agent Loops, Harnessing & Sandboxing

Mon, Jul 6

- ☐ **Study the ReAct loop and loop engineering** READ
Thought → Action → Observation as the core cycle; explicit termination logic (iteration caps, token budgets, no-progress detection). See Resources, Topic 1.
- ☐ **Study agent harness engineering** READ
The model is a small piece — the harness (tools, context, memory, guardrails, sandbox) is what actually makes an agent reliable.
- ☐ **Compare sandboxing approaches** READ
Docker Sandboxes (namespace/microVM isolation) vs. E2B (Firecracker microVMs) vs. Modal (gVisor) — tradeoffs of isolation strength vs. cold-start speed vs. cost. See Resources, Topic 2.

☐ **Ideate your hands-on project** NOTION TASK

Brainstorm full-stack project ideas that are deployable and genuinely useful day-to-day. Pick one small, real thing — see Project Ideas below — and sketch its architecture: what's the loop, what tool calls happen, what gets sandboxed, where it runs.

Day 5 — Capstone Build

Tue, Jul 7

☐ **Build a minimal end-to-end version of your Day 4 project** HANDS-ON

Agent loop with a clear stop condition, tool calls executed in a sandboxed/containerized environment, packaged with Docker, deployed to AWS. Small and working beats big and half-finished.

☐ **Write a short README / postmortem** HANDS-ON

What worked, what you'd harden before relying on it "for real," and 2–3 questions to ask your new team about their actual stack.

☐ **Plan the runway to Jul 20**

Pick 2–3 stretch topics to keep chipping at over the following two weeks — e.g. Kubernetes basics, IAM policy depth, more loop/orchestration patterns.

Resources

Curated for Days 1 and 4 (loops/harnessing/sandboxing) and Days 2–3 (Docker/AWS).

1. Agent loops & harness engineering

- [What Is the ReAct Loop? How AI Agents Reason, Act, and Iterate](#) — MindStudio
- [Loop Engineering for AI Agents \(2026 Guide\)](#) — HappyCapy
- [Agentic Loops: From ReAct to Loop Engineering](#) — Data Science Dojo
- [What Is the AI Agent Loop? The Core Architecture Behind Autonomous AI Systems](#) — Oracle Developers
- [Loop Engineering: How to Design Coding Agent Harnesses](#) — explainX (Claude Code-focused)

2. Sandboxing AI agents

- [Docker Sandboxes](#) — Docker Docs
- [Best Code Execution Sandboxes for Coding Agents in 2026](#) — Modal
- [AI Agent Sandbox: How to Safely Run Autonomous Agents in 2026](#) — Firecrawl
- [E2B vs Modal: comparing AI code execution sandboxes](#) — Northflank
- [Sandboxed Environments for AI Coding: The Complete Guide](#) — Bunnyshell

3. Docker

- [Docker Roadmap](#) — roadmap.sh (best single outline to follow hands-on)
- [Docker Crash Course for Beginners: The Full 3-Hour Tutorial \(2026\)](#) — YouTube
- [Learn Docker in 2026 – Complete Roadmap Beginner to Pro](#) — YouTube

4. AWS

- [AWS Roadmap](#) — roadmap.sh
- [Learn AWS \[Full Course\]](#) — Boot.dev
- [aws-lambda-roadmap](#) — official AWS GitHub repo, good for seeing where Lambda is headed

Project ideas (pick one for Days 4–5)

Portfolio-company digest agent

An agentic loop that pulls news/updates on a watchlist of companies, summarizes them, and posts a daily digest (email or Slack). Good vehicle for practicing tool calls + a scheduled/looped run.

Deal-memo drafting assistant

Feed it a data room or a set of docs; it drafts a first-pass memo using a sandboxed code-execution step for any data crunching. Good for practicing sandboxed tool use.

Meeting-notes → CRM sync tool

Takes raw meeting notes/transcripts, extracts structured fields, and syncs them into a lightweight tracker (even just a spreadsheet or small DB). Good for practicing the full container → deploy loop end to end.

Sourced from your Notion task tracker ("Watch video: The Complete Guide to Building AI Agents," "Ideate on a full-stack project to build and deploy") and current web resources as of July 2026. Adjust freely — this is meant to be a loose guide, not a strict schedule.
